World Agricultural Production

Dryness Takes Hold in Australia, Canada, and India

USDA's Online Crop Explorer Helps Analysts Track Agro-Meteorological Data Worldwide

USDA significantly lowered crop production estimates for Australia, India, and Canada for a variety of field crops. Persistent dryness and high temperatures affected Canada and Australia, while India waited for monsoon rains that failed to appear. Analysts may track how agro-meteorological conditions affect crops by using a new online USDA database, Crop Explorer. This database features graphs and maps of precipitation, temperature, and vegetative indices and is discussed on page 3.

India: Poor Monsoon Hampers Rice, Cotton, and Soybean Production

The 2002/03 Indian rice crop is forecast at 80 million tons, down 10.0 million or 11 percent from last month and down 11.6 million or 13 percent from last year (see figure). Production is revised downward based on a reduction in estimated planted area and expected lower yields, resulting from an erratic monsoon. Area is forecast at 42.5 million hectares, down 2.2 million or 5 percent from last month and down 2.3 million or 5 percent from last year.

Area is revised lower as dry conditions in rice growing areas have delayed or reduced sowings. In several rice-growing states, yield potential is declining with the continued dryness, stressing the crop. The 2002 southwest monsoon began with a relatively good start over most of the rice-growing areas. Since mid-July the monsoon precipitation has fallen below normal in many areas; especially hard hit are the kharif rice crop areas. This crop comprises approximately 88 percent of India's total crop and is highly dependent on the monsoon rains. In the irrigated states of Punjab and Haryana, irrigation reserves are being depleted at a high rate due to the above-normal temperatures, increased water use by the plants, and the absence of monsoon rains. Under similar weather in 1995, when major rice growing regions received poor rains until mid-July (but followed by satisfactory rains later), rice production declined by 5 million tons from the previous year's level

The 2002/03 India cotton crop is forecast at 10.5 million bales, down 1.0 million or 9 percent from last month and down 1.8 million or 15 percent from last year. Production is revised downward based on a reduction in estimated planted area resulting primarily from low cotton prices and lower yields

from an erratic and limited monsoon rainfall. In several cotton-growing states, yield potential has declined from lack of soil moisture and above-normal temperatures.

The 2002/03 India soybean crop is forecast at 5.0 million tons, down 0.8 million or 14 percent from last month and down 0.4 million or 7 percent from last year. Production is revised downward based on a reduction in estimated planted area and lower yields resulting from this season's erratic rainfall. Following the late though adequate planting rains, a prolonged dry spell in parts of Madhya Pradesh and Rajasthan reduced yield potential for the recently established crop. Conditions in Maharashtra are generally favorable. On average, Maharashtra produces 13 percent of India's total soybean crop; Madhya Pradesh, 74 percent; and Rajasthan, 10 percent. Overall rainfall for the soybean region remains significantly below normal. However, the distribution of the limited precipitation has been particularly well timed for the soybean crop. After a dry spell in late July, approximately 2 to 5 inches of precipitation fell August 3 over the entire soybean area, offsetting some of the negative impact of the previous hot and dry two weeks.

Australia: 2002/03 Wheat and Rapeseed Production Estimates Fall

Australia's 2002/03 wheat crop is estimated at 20.0 million tons, down 3.0 million from last month, and down 4 million from last year. Production is revised downward due to continued dryness in Queensland, New South Wales, and Western Australia. The 2002/03 rapeseed crop is estimated at 1.2 million tons, down 0.2 million from last month and down 0.5 million from last year.

Wheat area and yields are revised lower, based on lack of adequate rainfall for planting and crop establishment. Significant area reductions are anticipated in Queensland, northern New South Wales, and the eastern portion of Western Australia. Wheat areas in the southern growing states of Victoria and South Australia are expected to be similar to last season in response to generally favorable conditions, a later planting window, and improved price expectations. Wheat areas of West Australia, New South Wales, and Queensland received only 40 to 60 percent of normal precipitation for the period May 1 to July 31.

USDA's Online Crop Explorer Helps Analysts Track Agro-Meteorological Data Worldwide

The graphs below depict three capabilities of USDA's new Crop Explorer database, available free to the public at FAS Online <http://www.fas.usda.gov/pecad>. July 11, 2002, the U.S. Climate Prediction Center of the National Oceanic and Atmospheric Administration announced an El Nino weather pattern had begun.

Australia is experiencing dryness in major crop areas. Analysts may track estimated vegetative crop indexes against a 20-year normal curve, shown here lagging in New South Wales a

principle wheat area. This tool can help you watch if August/September rains will be in time to assist wheat and rapeseed crops before maturity.

New South Wales, GAC-NDVI (AVHRR-NOA)

USDA-FAS-PECAD

N Northern Zone, India, Temperature

USDA-FAS-PECAD

A poor monsoon and higher-than-normal temperatures are influencing crops across **India**. Depicted here, Crop Explorer can show analysts where temperatures in the Northern Zone have been above normal reducing yields. This reduced USDA's projection of Indian cotton production in this month's estimate.

If **Indonesia** rains fail to pick up in September, the rice crop may be reduced. Sixty percent of rice is grown in Jawa (Java) where cumulative precipitation is currently below normal, as tracked by Crop Explorer.

Jawa Barat, Cumulative Precipitation

Production Briefs

Canada: 2002/03 Wheat, Barley, and Rapeseed Production Slashed Due to Weather

Canadian wheat production is forecast at 18.0 million tons, down 5.0 million from last month, and down 3.3 million from last year. Barley production is forecast at 9.0 million tons, down 4.0 million tons from last month, and 2.4 million from last year. Rapeseed production is forecast at 3.9 million tons, down 1.6 million from last month, and down 1.2 million tons from last year.

Parts of the Canadian Prairie have been extremely dry since spring 2001, and the trend has continued through the 2002-growing season. The current growing season started out with a period of below-average temperatures, followed by a brief period of widespread moisture. Since crop emergence, dryness and above-normal temperatures have dominated the prairie, especially in Alberta and Saskatchewan. In addition, pests have been unusually abundant, and most recently, early frost has been reported in several places. Crop reports from Alberta indicate that no grain or oilseeds will be harvested from a large portion of the province. Manitoba appears to be in fair condition, and Saskatchewan crops are highly variable, ranging from very poor to good.

European Union: Variable Weather Reduces Wheat Production for 2002/03

Wheat production from the European Union (EU) is forecast at nearly 107.7 million tons in 2002, down nearly 1.0 million from last month, but up 16 million from last year. Weather during the growing season was ideal throughout much of central and northern Europe, but extreme heat damaged crops in Spain. In addition, wet weather in July has delayed harvesting in Germany. However, farmers in France, the largest wheat producer in the European Union, are forecast to produce 39.0 million tons, which would make it the second largest crop on record.

Kazakstan: Good Conditions for Spring Wheat

Kazakstan wheat production for 2002/03 is estimated at 12.0 million tons, up 1.0 million or 9 percent from last month, but down 0.7 million or 6 percent from last year. The spring wheat crop has benefited from generally favorable weather in north-central Kazakstan, the main grain region. Precipitation has been adequate, and the crop was not subject to heat stress during the flowering stage.

Ukraine: Excessive Heat in Corn Region

Ukraine corn production for 2002/03 is estimated at 3.0 million tons, down 0.7 million or 19 percent from last month and down 0.6 million or 17 percent from last year. Area is estimated at 1.2 million hectares, up 4 percent from last year. Temperatures in southern and eastern Ukraine – the country's key corn region – were unusually high during mid-July, as the crop advanced through the heat-sensitive reproductive stage.

Uzbekistan: Wheat Harvest Reaches Record Level

Uzbekistan wheat production for 2002/03 is estimated at 4.7 million tons, up 0.7 million or 18 percent from last month and up 1.3 million or 38 percent above last year. Area is estimated at 1.2 million hectares, the same as last year. After three years of drought, winter wheat, the country's main grain crop, benefited from above-normal amounts of winter and spring precipitation. Official reports indicate that the grain harvest is virtually complete and that yields reached record.

Brazil: 2002/03 Corn Production Estimates Fall as Soy Outlook Brightens

Brazil's corn crop for 2002/03 is estimated at 37.0 million tons, down 1.5 million from last month. Harvested area is estimated at 12.4 million hectares, down 0.6 million from last month. Brazil's soybean crop is estimated at a record 48.0 million tons, up 1.0 million from last month. USDA forecasts soybean area at a record 17.5 million hectares, up 0.5 million from last month. Initial estimates for 2002/03 corn production issued in May assumed that the domestic shortfall in 2001/02 would result in increased corn planting for 2002/03. Total corn area was forecast to rebound, strongly. This analysis held true through June when corn and soy profitability was in rough parity in the region. However, by July's end, strengthening soybean futures prices and a strongly depreciating Brazilian currency tipped the balance to favor soybean cultivation in 2002/03. Corn area is still expected to be up slightly from 2001/02.

Germany: Rapeseed Output Benefits from Biodiesel

German rapeseed area and production are higher in 2002/03 partly due to investments in its biodiesel industry. Harvested area is estimated up 12 percent from last year to 1.28 million hectares, while production is estimated up 8 percent to 4.5 million tons.

Germany sees biodiesel production from rapeseed oil as one way to help meet its obligations under the Kyoto Protocol to reduce greenhouse gas emissions. Rapeseed oil or another vegetable oil in the presence of a catalyst can be made to combine with methanol to form methyl-ester and glycerin. Methyl ester can be used in diesel engines with little or no modification. Methyl-ester is biodegradable, produces fewer sulfur emissions, is less toxic than petrochemical diesel, and making it less polluting. During 2002, around 200,000 tons of new rapeseed diesel production capacity is due to come on line. Sales by biodiesel fuel producers in Germany are running around 500,000 tons annually, using 1.32 million tons of rapeseed.

In Germany, methyl-ester used for transportation receives a 100-percent exclusion from the motor fuel tax to encourage use of the product and development of the biodiesel industry. Additionally, rapeseed can be grown on set-aside land for industrial purposes (mostly biodiesel) without losing Common Agricultural Policy (CAP) set-aside compensation payments. Looking ahead, biodiesel production may get an additional boost if a current proposal before the EU Commission is put into effect. The proposal would require 5.75 percent of motor transport fuels to be produced from renewable resources by 2010.

This report uses information from the Foreign Agricultural Services= global network of agricultural attaches and counselors; official statistics of foreign governments and other foreign source materials; and the results of economic and satellite imagery analysis. Estimates of foreign area, yield and production are from the Production Estimates and Crop Assessment Division, FAS, and are reviewed by USDA=s Inter-Agency Commodity Estimates Committees. Estimates of U.S. area, yield, and production are from USDA=s National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-389), August 12, 2002.

This report was prepared by the Production Estimates and Crop Assessment Division, FAS/USDA. The next issue of World Agricultural Production will be released after 9:00 a.m. Eastern time on September 12, 2002.

TABLE 18

The table below presents a 21-year record of the differences between the August projection and the final estimate. Using world wheat production as an example, changes between the August projection and the final estimate have averaged 12.2 million tons (2.3 percent) and ranged from -32.1 to 19.5 million tons. The August projection has been below the final 12 times and above the final 9 times.

RELIABILITY OF PRODUCTION PROJECTIONS

COMMODITY AND REGION	PROJECTION AND FINAL ESTIMATES, 1981/82 - 2001/02 1/
